amylase A (EC 3.2.1.-) - Dictyoglomus thermophilum
C; Species: Dictyoglomus thermophilum
C; Species: Dictyoglomus thermophilum
C; Date: 30-Jun-1991 #sequence_revision 30-Jun-1991 #text_change
C; Accession: S00628; A34969
R; Fukusumi, S.; Kamizono, A.; Horinouchi, S.; Beppu, T.
Eur. J. Biochem. 174, 15-21, 1988
A; Title: Cloning and nucleotide sequence of a heat-stable amylas
A; Reference number: S00628; MUID:88225097
A; Accession: S00628
A; Molecule type: DNA
A; Residues: 1-686 <FUK>
A; Accession: A34969
A; Molecule type: protein
A; Residues: 2-13 <FUK2>
C; Genetics:
A; Residues: 2-13 <FUK2>
C; Genetics:
A; Residues: amyA
C; Superfamily: Dictyoglomus thermophilum amylase A
C; Keywords: glycosidase; hydrolase
F; 2-686/Product: amylase A #status experimental <MAT>

DNA Res. 5, 55-76, 1998
A; Title: Complete sequence and gene organization of the genome of a hyper-thermophili
A; Reference number: A71000; MUID: 98344137
A; Accession: G71241
A; Status: preliminary; nucleic acid sequence not shown; translation not shown
A; Molecule type: DNA
A; Residues: 1-633 < KAW>
A; Residues: 1-633 < KAW>
A; Residues: 1-632 < KAW>
A; Residues: 1-632 < KAW>

RESULT 11
S52737
NADH dehydrogenase (ubiquinone) (EC 1.6.5.3) 76K chain precursor - potato
N;Alternate names: mitochondrial complex I 76K chain
C;Species: Solanum tuberosum (potato)
C;Species: Solanum tuberosum (potato)
C;Date: 19-May-1995 #sequence_revision 10-Nov-1995 #text_change 11-Jun-1999
C;Accession: S52737
R;Rasmusson, A.G.; Grohmann, L.
Submitted to the EMBL Data Library, March 1995
A;Accession: S52737
A;Accession: S52737
A;Accession: S52737
A;Accession: S52737
A;Accession: S52737
A;Accession: S52737
A;Coss-references: EMBL:X85808; NID:9758339; PIDN:CAA59818.1; PID:9758340
C;Superfamily: NADH dehydrogenase (ubiquinone) chain 11
C;Superfamily: NADH dehydrogenase (ubiquinone) chain 11
C;Keywords: membrane-associated complex; mitochondrion; NAD; oxidoreductase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21;

hypothetical protein PAB1309 - Pyrococcus abyssi (strain Orsay)
C;Species: Pyrococcus abyssi
C;Species: Pyrococcus abyssi
C;Date: 20-Aug-1999 #sequence_revision 20-Aug-1999 #text_change 20-Jun-2000
C;Accession: F75006
R;anonymous, Genoscope
submitted to the EMBL Data Library, July 1999
A;Description: Pyrococcus abyssi genome sequence: insights into archaeal chromosome stru
A;Reference number: A75001
A;Accession: F75006
A;Status: preliminary
A;Molecule type: DNA
A;Molecule type: DNA
A;Molecule type: DNA

THE LIGHT CHAIN HAS THE PHARMACOLOGICAL ACTIVITY, WHILE THE N-AND C-TERMINAL OF THE HEAVY CHAIN MEDIATE CHANNEL FORMATION AND TOXIN BINDING, RESPECTIVELY.

SUBCELLULAR LOCATION: SECRETED.

MISCELLANEOUS: THERE ARE SEVEN ANTIGENICALLY DISTINCT FORMS OF BOTULINUM NEUROTOXIN: TYPES A, B, C1, D, E, F, AND G.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27 (ZINC METALLOPROTEASE); ALSO KNOWN AS THE TETANUS/BOTULINUM NEUROTOXIN SUBFAMILY.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             lactic acid; food industry; food-grade inducer; cheese production; rnhB; gadR; gadC; orfX; rggL.
                                                                                                          This protein comprises AEDII12RA-alpha-gal-18GC, a claimed
thermostable alpha-galactosidase of Thermococcus alcaliphilus
AEDII12RA, a bacterium that shows optimum growth at 85 deg C and
pH 9.5. Also claimed are: (1) an isolated polynucleotide (see
ATT93753) encoding the alpha-galactosidase; (2) a vector containing
the polynucleotide or homologous or complementary sequences; (2)
host cells containing the vector; (3) a process for producing the
alpha-galactosidase in transformed or transfected host cells; an
enzyme showing at least 70% identity to alpha-galactosidase and
comprising at least 30 amino acid residues of its sequence; and (4)
a method for hydrolysing alpha-galactoside bonds using the enzyme.
The enzyme can be used to hydrolyse raffinose to sucrose and glucose in sugar beet processing (raffinose inhibits crystallisation of sucrose), and as a digestive aid to hydrolyse raffinose, stachyose and verbascose in beans and other gassy foods.
                                                                                                                                                                                                                                                                                                       glucose

from the NS3 locus of the lactic acid bacterium Lactococcus lactis. This fragment also contains the C-terminus of rnhB, full length gadR protein (also known as rggL), gadC protein (also known as orfX) and the C-terminus of an unknown reading frame which reads in the reverse orientation. This fragment is also found to act as a salt-inducible promoter (SIP). Using this SIP, salt can be used as a food-grade inducer in food fermentation processes, e.g. in the production of cheese, dressings, water-containing spreads, sausages, or sour dough.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        disease; pneumonia; bronchitis; heart disease; sarcoidosis; purulent otitis media; erythema nodosum; pharyngitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae.

C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, cancer antigens have cytostatic activity and can be used in gene diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB37789 represent sequences used in the exemplification of the

AAB30440-85 represent peptides derived from galectin family members. Galectin-3 has been associated with assorted processes such as cell growth, tumour transformation, and metastasis. It is composed of two domains: a carbohydrate-binding region on the carboxy terminal which binds saccarides with terminal galactose residues, and an amino terminal domain consisting of tandem repeats of nine amino acids. The expression of galectin-3 is induced in cirrhotic liver and hepatocellular carcinoma. Galectin-3 is used in diagnostic, prognostic and therapeutics for the treatment and prevention of hepatocellular carcinoma. It is useful for determining whether an individual is suffering from hepatocellular carcinoma or is likely to suffer from hepatocellular carcinoma or any neoplasm of liver origin or cirrhosis of
                                                                                                                                                                                                               cirrhotic liver;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful

human secreted proteins, and encode the proteins given in AAY12987 to AAY13219, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone capulating activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products activity, the used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into a cell.

Claim 27; Page 727-728; 824pp; English

called pancreatic cancer antigens, given in AAB54008

proteins,

human secreted proteins, and encode the proteins given in AAX12261 to
AAV12514, respectively. The proteins given represent the signal peptide
and an N-terminal fragment of a secreted brown in The nucleic acid
sequences can be used for producing secreted human gene products. They
can also be used to develop products for diagnosis and therapy. The
proteins obtained may have cytokine activity, cell
proliferation/differentiation activity, haematopoiesis regulating
activity, tissue growth regulating activity, reproductive hormone
regulating activity, chemotactic/ chemokinetic activity, haemostatic and
thrombolytic activity, receptor/ ligand activity, anti-inflammatory
activity, tumour inhibition activity or other activities. The products
can be used in forensic, gene therapy and chromosome mapping procedures.
The sequences can also be used for obtaining corresponding promoter
sequences. The nucleic acids encoding the signal peptide can be used for
directing extracellular secretion of a polypeptide into a cell. tags (ESTs) for n in AAY12261 to Human; pancreas; pancreatic cancer; pancreatic cancer antigen; detection; diagnosis; identification; cytostatic; neuroprotective; nootropic; immunomodulatory; relaxant; contraceptive; gynaecological; antiinflammatory; cardiant; gene therapy; chromosome mapping; linkage analysis; tissue identification; tissue typing; forensic; neural; immune system; muscular; reproductive; gastrointestinal; pulmonary; cardiovascular; renal; proliferative. New nucleic acid that is a pancreatic cancer antigen for preventing, treating, or ameliorating a medical condition, particular pancreatic cancer, or for use in assays for diagnosing a pathological condition AAC98773 to AAC99231 encode the human pancreatic cancer associated Human pancreatic cancer antigen protein sequence SEQ ID NO:879. .; 0 Length 116; Indels sedneuce 0; DB 20; . 52; expressed Score 7; DB 2 Pred. AAB54466. The human pancreatic cancer antigens have cytostatic, neuroprotective, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Agonists and antagonists to the antigens can be used to design nucleic acid hybridisation probes, that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic
                                                                                                                                                                                                                                                                                      system, muscular,

The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences
                                                                                                                                                                                                                             and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders. AAC99232 to AAC99240 and AAB54467 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vaccine; eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

n pathway; metabolic pathway; expression control; promoter;
can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
